Northern Utah Interagency
Fire Dispatch Center

Green Project Winner

BEST GREEN PROJECT

New Fire Dispatch Center Meets Sustainable Goals

The Northern Utah Interagency Fire Dispatch Center is located west of I-15 in Draper. The 9,400-sq-ft, LEED-Gold facility includes a network communications center, administrative offices, conference rooms and training areas. State-of-the-art communication and dispatch systems allow instantaneous transmission of information for fire response throughout the northern part of the state.

The center's many green elements make it environmentally friendly and efficient to operate and maintain. The building is oriented so that natural light floods the interior. A ground-source heat pump system keeps heating and cooling costs at a minimum. Insulated con-

crete forms reduce noise pollution from the nearby interstate and help insulate the building, while a white rooftop reduces the heat-island effect. Other green features include water-saving toilets and lavatory fixtures and an efficient lighting system. The landscaping uses water-wise plants and rocks as ground cover around the building.

The team coordinated with four agencies on the project: the State of Utah, Bureau of Land Management, Dept. of Natural Resources and the U.S. Forest Service. Each was involved in the facility's design, and each had specific requirements. The team's coordination and cooperation satisfied the agencies and met their project goals.
